Dear Atomic Object Hiring Team,

I am excited to apply for the Software Developer Accelerator position at Atomic Object. I recently completed my Master of Science in Computer Science at the University of Southern California, and I have more than two years of experience building web, backend, and data-driven applications. What particularly attracts me to Atomic is the opportunity to combine hands-on software development with close client collaboration while working on small, multidisciplinary teams that take products from early ideas through launch and continued improvement.

In my current role as a Software Engineer at USC Dornsife, I work directly with stakeholders to translate ambiguous workflow requirements into production software. I have developed Python APIs and Azure SQL features supporting more than 500 users, while optimizing system performance to reduce response latency from 1.2 seconds to 350 milliseconds. I have also owned improvements from design discussions through release, including refactoring workflows, adding automated tests, improving recovery mechanisms, and documenting technical decisions.

My previous experiences have further developed the combination of technical and consulting skills that Atomic values. At Grad8, I collaborated with product stakeholders and users to build Flask services handling more than 10,000 daily requests and responsive React interfaces, continuously refining functionality based on user feedback. At Aasma Technology Solutions, I developed client-facing software using Python, JavaScript, Node.js, AWS, SQL, and microservices while participating in design discussions, code reviews, automated testing, deployment, and production support.

I am particularly interested in Atomic's project-based environment because I enjoy learning new technologies and domains rather than working within a narrow technical area. My experience spans TypeScript, React, Python, Java, C++, SQL, REST APIs, cloud platforms, databases, testing, CI/CD, and distributed application development. More importantly, I enjoy understanding why a product is being built, communicating technical tradeoffs clearly, and working with others to arrive at solutions that are both technically sound and useful to the people they serve.

Atomic's combination of software craftsmanship, client partnership, small-team ownership, and continuous learning closely matches the kind of engineer I want to become. I would be excited to bring my technical foundation, curiosity, and collaborative approach to the Accelerator program and contribute to building thoughtful software products for Atomic's clients.

Thank you for your consideration. I would welcome the opportunity to discuss how my background and approach to software development could contribute to Atomic Object.

Sincerely,
Sahaj Bhadja
