RE: Solutions Specialist - Science-to-HPC/IT

Dear Cambridge Computer Hiring Team,

I am excited to apply for the Solutions Specialist - Science-to-HPC/IT position. With an M.S. in Computer Science from the University of Southern California and hands-on experience across scientific computing, AI/ML, Linux, cloud infrastructure, and customer-facing solution design, I can help translate researchers' computational goals into practical architectures and clear technical recommendations. Cambridge Computer's combination of deep technical work, multi-vendor solution design, and long-term client partnership is exactly the environment in which I want to build my career.

At USC's Autonomous Driving Lab, I built reproducible Python and PyTorch pipelines that processed more than 100,000 trajectory records and improved long-horizon planning by 18%. I analyzed simulation and model-training workloads, documented architecture and experimental tradeoffs, and presented recommendations to senior researchers, contributing to a 15% improvement in closed-loop stability. That experience taught me to begin with the scientific objective, understand its data and compute demands, and communicate the resulting technical choices in language appropriate for both domain experts and broader stakeholders.

I have also designed and optimized production infrastructure across Linux, Docker, AWS, Azure, GCP, PostgreSQL, SQL Server, S3, and cloud storage. At USC Dornsife, I translated research and application requirements into scalable FastAPI and database workflows handling 5,000+ monthly jobs, tripled concurrent throughput, and reduced dashboard latency from 1.2 seconds to 350 milliseconds. Previously, at Aasma Technology Solutions, I helped build cross-platform data infrastructure that increased pipeline efficiency by 68% and reduced storage costs by 15%. These projects required workload analysis, careful documentation, cost awareness, security considerations, and collaboration from requirements through deployment - all directly relevant to developing credible HPC and AI/ML solutions.

Just as important, I enjoy the translator role at the center of this position. I have mapped integration requirements, presented end-to-end architecture recommendations to clients, worked with Microsoft and GitHub stakeholders, and evaluated model usage, failure modes, and costs across multiple AI platforms. I would bring that same curiosity and precision to technical demonstrations, proposals, RFPs, CRM records, vendor certifications, and post-sales support. I am also comfortable traveling for client engagements and industry events.

I would welcome the opportunity to help Cambridge Computer's scientific clients turn demanding research workloads into reliable, high-value computing environments. Thank you for your time and consideration.

Sincerely,
Sahaj Bhadja
