Hiring Committee
Information Technology / Enterprise Application Services
University of Denver
Denver, CO

Re: Web Developer I (Job No. 498940)

Dear Hiring Committee,

I am excited to apply for the Web Developer I position with the University of Denver's Information Technology/Enterprise Application Services team. I recently completed my M.S. in Computer Science at the University of Southern California and bring more than two years of experience building responsive, secure, database-backed web applications for university and production environments. The opportunity to support DU's Drupal- and WordPress-based web properties while partnering with campus stakeholders strongly aligns with my background in web development, application support, and higher-education technology.

In my current work with USC Dornsife, I build secure web services and operational dashboards used by more than 500 university users, using Python, Azure SQL, and Blob Storage. I improved page-data response latency from 1.2 seconds to 350 milliseconds and developed reliable workflow features supporting more than 5,000 monthly jobs. Previously at Grad8, I developed responsive React interfaces and Flask REST services handling 10,000+ daily requests for 150+ university instructors, including secure uploads, authentication, grading history, and feedback workflows. These experiences required close attention to usability, performance, data integrity, production support, and communication with non-engineering users.

My broader web-development experience includes JavaScript, TypeScript, HTML5, CSS3, React, Next.js, Node.js, Python, SQL, REST APIs, JSON, authentication and role-based access control, responsive design, automated testing, CI/CD, monitoring, and technical documentation. At Aasma Technology Solutions, I developed reusable React and Node.js features across eight services, synchronized more than two million Azure SQL records, and helped reduce release time by 50 percent through automated builds, browser-facing tests, and staged deployments. I have also translated client requirements into maintainable booking and payment workflows, strengthening the project ownership and client-support skills emphasized in this role.

While my most recent production work has centered on modern JavaScript and Python frameworks rather than Drupal or WordPress, I have a strong foundation in web architecture, content-driven interfaces, secure coding, APIs, databases, and responsive design, along with a track record of learning new platforms quickly. I would welcome the opportunity to bring that foundation to DU, contribute to accessible and reliable university web experiences, and grow within the IT/EAS web development team.

Thank you for your consideration. I would be glad to discuss how my web-development experience, university technology background, and focus on reliable user-centered solutions can contribute to the University of Denver.

Sincerely,
Sahaj Bhadja
